

## Press Release HWAM Heat Design

### Automatic

**Very few use their wood-burning stove correctly. It is a question of controlling air inlet, temperature, and wood. With HWAM Automatic you have it all under control.**

Comfort, environment, and especially economics form a synthesis when you use a wood-burning stove with Automatic. As the only producer in the market HWAM Heat Design has a patented solution.

The Automatic system secures optimal combustion without any form of manual regulation and matches the increasing demands from environmental agencies regarding correct firing in wood-burning stoves.

Basically the issue is controlled air supply. This may seem to be an easy task. But there is a great difference to which air types are needed in the three phases of the fire: Lighting, combustion and End-phase.

»With the Automatic system it all runs automatically, even if the wood is not dry enough. The indoor climate will improve, the temperature can be adjusted according to your needs and at the same time you get a calmer view of the flames« states the founder and owner Vagn Hvam Pedersen, of HWAM Heat Design in Hoerning, Denmark.

The environment is also considered. The Automatic secures an even combustion pace which not only prolongs combustion, but also results in less soot, less complaints from neighbours, and less impact on environment.

»The added bonus is that you get less work cleaning for ashes and soot. With the Automatic system we have made it easy to use a wood-burning stove.

Economy is also an issue. Our calculations show that with automatic you can reduce your wood consumption by 30%. And the profit contributes to cut off pay-back time« Vagn Hvam Pedersen points out.
